
End of Life: Assima STT-Trainer

Announcement

Given the continuous increase in the demand for Assima's new Cloud Solutions, we've decided to streamline its development and support operations, and stop our support for Assima STT-Trainer software from midnight on the 31st March 2022.

This decision is in line with the Company's continuous commitment to offer best-in-class service to its customers, while you determine your future strategy.

Indeed Assima has created the ability for you to continue to reap the benefits of your investment in STT- Trainer in 2 ways:

1. All STT-Trainer created Scorm packages can be imported into the [Assima Cloud Platform](#) and can continue to be edited and published. The published material can be consumed by end users via the Assima Cloud Platform or via Scorm upload to your LMS. Please watch the video below for more details.
2. Should you move to the Assima Cloud Platform then discount will be provided for existing maintenance paying customers, taking into effect the investment you have made to Assima products over the years.

Notes

If your current maintenance contract ends after the 31st March 2022, we will keep supporting you until the end of your contract

If you wish to renew your maintenance until your solution reaches EOL, Assima will prorate your annual maintenance cost.

Assima's Cloud Platform ensures the adoption of business systems by end users through its technologies that train and mentor end users from UAT through to BAU. The Assima Train module is used within induction and in training end users pre system go live. Assima Train content along with any other training material is held on the Assima Collaborate Platform and can be consumed via its portal or uploaded to your Scorm LMS. The Assima Assist module is a performance support layer that sits over the top of live applications providing help, guidance, AI and RPA benefits.

Please contact us via the form below to know what are your migration options, or to learn more about how Assima's newer technologies can help you solve your user adoption challenges and make your employees more productive.
